**Doesn't work in X99 Desktop Motherboards**

Reviewed in the United States on April 16, 2019

**Verified Purchase**

Dear colleagues,

We've been using Tesla cards on Microsoft Azure VMs for about 2 years. Our main application is CST EM simulations.

We ordered this V100 32gb board and tried it in three computers. Asus X99 motherboard: Did not boot in any PCIe configuration. Gygabyte X99 motherboard: Did not boot in any PCIe configuration. Asus X299 motherboard w/ i9-9900x: Booted and recognized in Windows 10.

In the end, we ended up returning the board since it didn't work in our workstations. The X299 motherboard was promising -- so try it out.

Best regards,  
Dmitry

**Not as much power as I was anticipating**

Reviewed in the United States on September 7, 2021

This card overall, a disappointment. I bought to help it my rtx 3090 run Crysis at max settings. There was practically no difference so I thought maybe a second tesla card all linked in SLI would be better. Nope. Two more cards later and Crysis still can't surpass 75 FPS. I'm running out of organs to sell to front the payments on these cards, you'd think nvidia would know how to make a card run one simple video game. I guess I'll need to get some more organs from people :(
